Abstract

In mobile telephone terminal at the transmitting end, voice data to be transmitted are sequentially inputted, and it is determined whether 5 the inputted voice data are silent. The voice data regarded as silent voice are replaced by group numbers, while the voice data indicative of sonant voice as well as the group numbers as replaced are transmitted 10 by wireless. On the other hand, in a mobile telephone terminal at the receiving end, the signals transmitted by wireless are received, and the voice data and group numbers of the received signals are discriminated. The voice data are reproduced as they are, while the 15 group numbers are reproduced as silent, and further processings based on the group numbers are executed. allows predetermined data to be repetitively transmitted with a high efficiency without degrading This communication quality very much. also 20 facilitates a follow-up participation in a group call.
